

# Latest developments in ROOT::Math

Magdalena Sławińska

12th October 2007

- 1 Introduction
- 2 Numerical Integration
  - New classes for multidimensional integration
  - Comparison of performance
  - Interface
- 3 Implementing special functions
  - Base functions
  - Probability distributions
- 4 On-line documentation
  - Maths @ TWiki
  - On-line inventory

# Restructuring and Extending Mathematical Libraries

- 1 Revise already implemented functions and algorithms:
  - Testing accuracy, time performance, domains,
  - Crosschecking with well-established implementations: GSL, Mathematica
  - (Re)implementing existing ones.
- 2 Add useful routines.
- 3 Provide convenient user interfaces.
- 4 Reduce dependency on GSL libraries and other ROOT classes (TF1).

# What I did

- 1 New classes for multidimensional integration, using:
  - Adaptive cubature
  - Monte Carlo integration
- 2 Reimplementation of major special functions and probability distributions
- 3 On-line documentation (TWiki, upgrade of Inventory), tutorials.

# Adaptive cubature

- Checking existing algorithms (ROOT::TF1, TFoam, HintLib)
  - → the best applies Genz-Malik cubature
  - → the best implementation in TF1 class
- Extend functionality of TF1::IntegralMultiple.
  - independence on TF classes and hist library,
  - usage for free functions,
  - and arbitrary number of dimensions (not only 2 or 3).

→ **IntegralMultiDim class**

## IntegralMultiDim class - usage

```
ROOT::Math::WrappedParamFunction<> fptr1(&Func, NDim);
```

```
ROOT::Math::IntegratorMultiDim ig1;
```

```
ig1.SetFunction(fptr1);
```

```
ig1.Integral(xmin[], xmax[]);
```

# Applying Monte Carlo algorithms

- C++ interface to algorithms from GSL
- MC algorithms for the first time in ROOT (these from RooFit are not universal)
- Good functionality (not restricted to TF objects)

→ **GSLMCIntegrator class**

# The usage of GSLMCIntegrator class

```
ROOT::Math::WrappedParamFunction<> fptr(&Function, NDim);  
ROOT::Math::GSLMCIntegrator ig1();
```

## Setting algorithm

```
ig1.SetType(ROOT::Math::MCIntegration::VEGAS);  
ig1.SetMode(ROOT::Math::MCIntegration::IMPORTANCE);
```

## Setting additional parameters

```
VegasParameters param;  
param.iterations = 2;  
ig1.SetParameters(param);
```

```
ig1.SetFunction(fptr);  
ig1.Integral(xmin[], xmax[]);
```

## Adaptive Cubature vs Monte Carlo

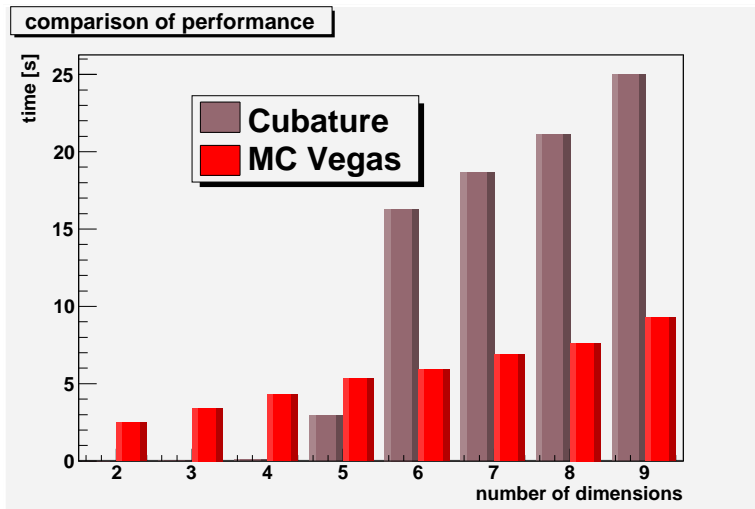

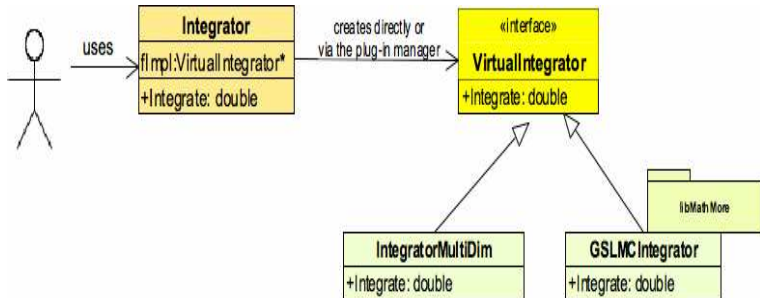

Figure: Achieved accuracy: 0.01

# Interface

Using the **plug-in manager** one can load GSL implementation in MathMore

# Special functions

## Major special functions

- commonly used in physical calculations,
  - (upper) incomplete gamma,
  - incomplete beta
- used for implementing other functions:
  - $\chi^2$  (used in statistical tests performed many times)
  - $F$ - distribution, Student- $t$  distribution, etc (for statistical analysis).

## After testing several implementations decided on CEPHES

- free usage netlib
- GSL need license
- NR copyrighted “no transfer or distribution”
- many other pros...

# Gamma and related functions

Old TMath

New MathCore

- **Gamma, LnGamma** ▶ Def

- Implementation from NR

- Domains:  $(0, \infty)$

- Independent on GSL

- Domains extended to  $(-\infty, \infty) \setminus \mathbb{Z}_-$

# Gamma and related functions

## Old TMath

## New MathCore

### ■ Gamma, LnGamma ▶ Def

- Implementation from NR
- Domains:  $(0, \infty)$
- Efficiency  $11 \cdot 10^{-5}$  (s/100 calls)

▶ gamma comparison

- Independent on GSL
- Domains extended to  $(-\infty, \infty) \setminus \mathbb{Z}_-$
- Efficiency  $5 \cdot 10^{-5}$  (s/100 calls)

# Gamma and related functions

Old TMath

New MathCore

- **Upper incomplete gamma** ▶ Def
- Implementation from NR
- Implementation independent of GSL

# Gamma and related functions

Old TMath

New MathCore

## ■ Upper incomplete gamma

▶ Def

- Implementation from NR
- Efficiency  $11 \cdot 10^{-5}$  (s/100 calls)

- Implementation independent of GSL
- Efficiency  $7 \cdot 10^{-5}$  (s/100 calls)

▶ inc gamma comparison

# Beta and related functions

## Old TMath

- **Beta function** ▶ Def

- **Beta already implemented in TMath**

## New MathCore

- **Implementation based on CEPHES**

# Beta and related functions

## Old TMath

- **Beta function** [▶ Def](#)

- **Beta already implemented  
in TMath**

[▶ beta comparison](#)

## New MathCore

- **Implementation based on  
CEPHES**

# Beta and related functions

## Old TMath

## New MathCore

- **Incomplete Beta** ▶ Def

- **Implementation in TMath  
from NR**

- **Implementation  
independent of GSL**

# Beta and related functions

## Old TMath

## New MathCore

### ■ Incomplete Beta ▶ Def

- Implementation in TMath from NR
- Efficiency  $4 \cdot 10^{-4}$ (s/100 calls)

- Implementation independent of GSL
- Efficiency  $4 \cdot 10^{-4}$ (s/100 calls)

# Beta and related functions

## Old TMath

### ■ Incomplete Beta [▶ Def](#)

- Implementation in TMath from NR
- Efficiency  $4 \cdot 10^{-4}$ (s/100 calls)

[▶ inc beta comparison](#)

## New MathCore

- Implementation independent of GSL
- Efficiency  $4 \cdot 10^{-4}$ (s/100 calls)

# Error function

## Old TMath

- implementation from NR

## New MathCore

- from CEPHES library

# Error function

## Old TMath

- implementation from NR

## New MathCore

- from CEPHES library
  
- Efficiency around 0 better in CEPHES ( 10%), tails better in TMath (factor 2)

# Error function

## Old TMath

- implementation from NR

## New MathCore

- from CEPHES library
- Efficiency around 0 better in CEPHES ( 10%), tails better in TMath (factor 2)
- Improvement in accuracy! (single  $\rightarrow$  double precision)

► erfc comparison

# Probability distributions & cumulatives

Using new implementation of `inc_gamma` and `inc_beta` one can reimplement

▶ `chi2` comparison

▶ `F` comparison

▶ Student-t comparison

independently of GSL and NR!

The new implementation in MathCore uses

- base functions from CEPHES library,
- reflexive property for `inc_beta` function ● to calculate complementary cumulatives

## Mathematical Libraries in [ROOT](#)

The aim of Math libraries in [ROOT](#) is to provide and to support a coherent set of mathematical and statistical functions. The latest developments have been concentrated in providing first versions of the [MathCore](#) and [MathMore](#) libraries, included in ROOT v5.08. Other recent developments include the new version of [MINUIT](#), which has been re-designed and re-implemented in the C++ language. It is integrated in [ROOT](#). In addition, an optimized package for describing small matrices and vector with fixed sizes and their operation has been developed ([SMatrix](#)).

The structure is shown in the following picture.

**Histogram library**
